

# Multitasking in iOS 7

Tech Talk - January 2014

# Why use multitasking?

---

- ⚙️ **Users** can do multiple things at once (e.g. using an app while talking on the phone).
- ⚙️ **Devices** can do things in the background without bothering users.
- ⚙️ However, battery life is always a priority for Apple.

# Multitasking in iOS 6

---

- ⚙ Background Task Completion
- ⚙ Background Audio
- ⚙ Location Services
  - ⚙ Region Monitoring
  - ⚙ Significant Location Changes
  - ⚙ Continuous Location Monitoring
- ⚙ VoIP
- ⚙ Newsstand
- ⚙ Push Notifications

# Multitasking Enhancements in iOS 7

---

- ⚙ Fast App Switcher
- ⚙ Background Fetch
- ⚙ Remote Notifications
- ⚙ Background Transfer Service

# App Switcher in iOS 4-6

---

- ⚙️ Foreground app **shifts** upwards, reveals row of icons.
- ⚙️ Row of icons includes foreground app as well as all backgrounded apps.
- ⚙️ You can switch between apps by tapping on the icons.

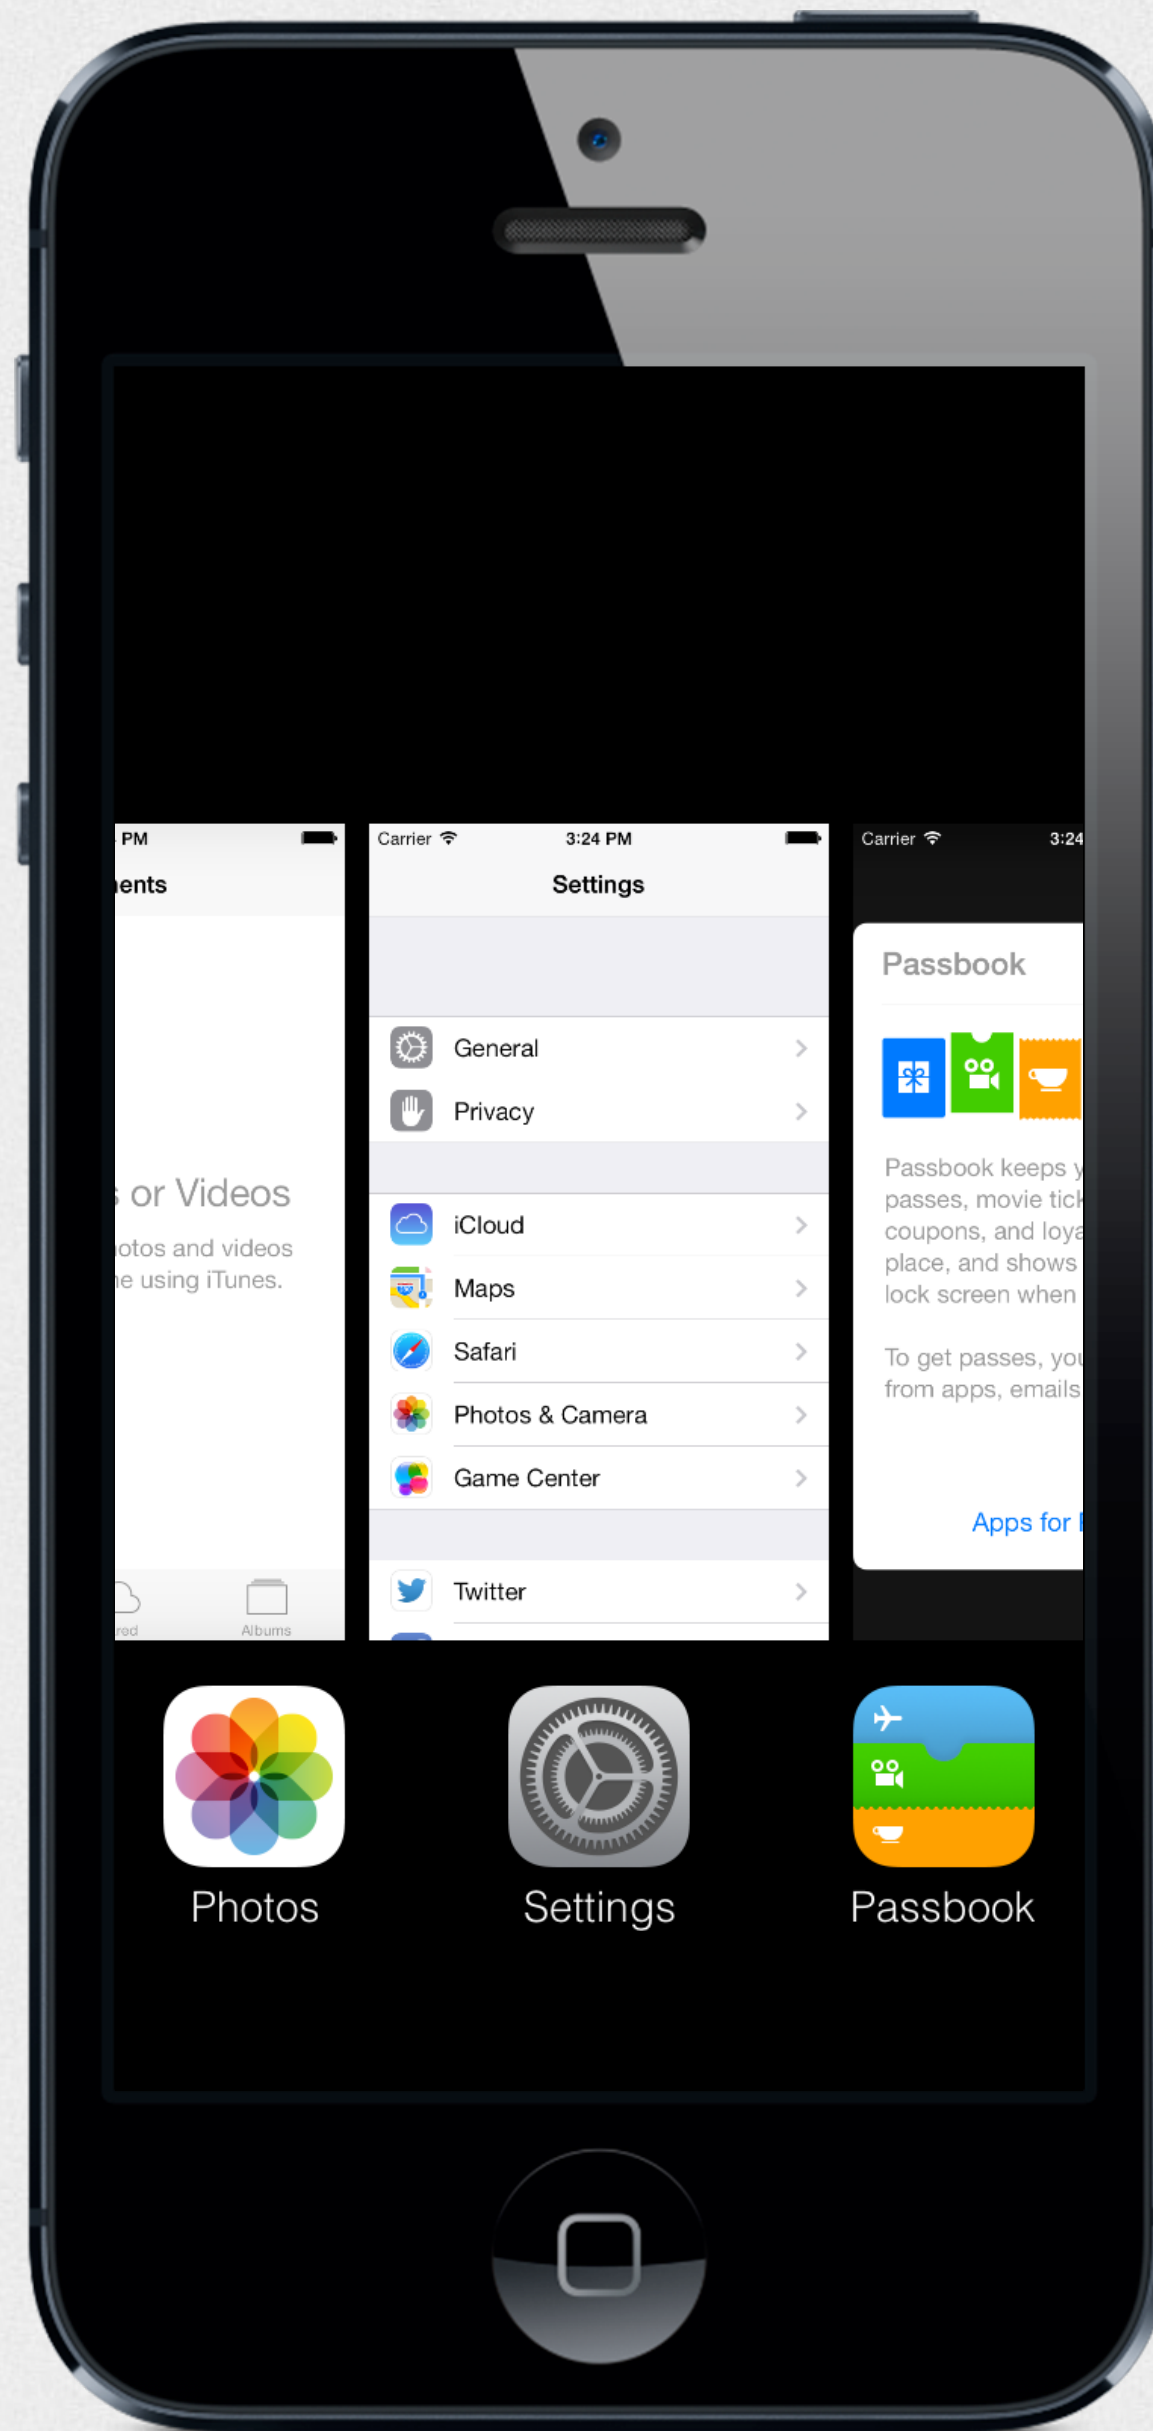

# App Switcher in iOS 7

---

- ⚙️ Foreground app **zooms out** to reveal row of icons at the bottom and row of screenshots on top.
- ⚙️ You can switch between apps by tapping on the icons or the screenshots.
- ⚙️ Problem & opportunity: what should the screenshot be?
- ⚙️ New: flick screenshot upwards to terminate app, turn off multitasking.

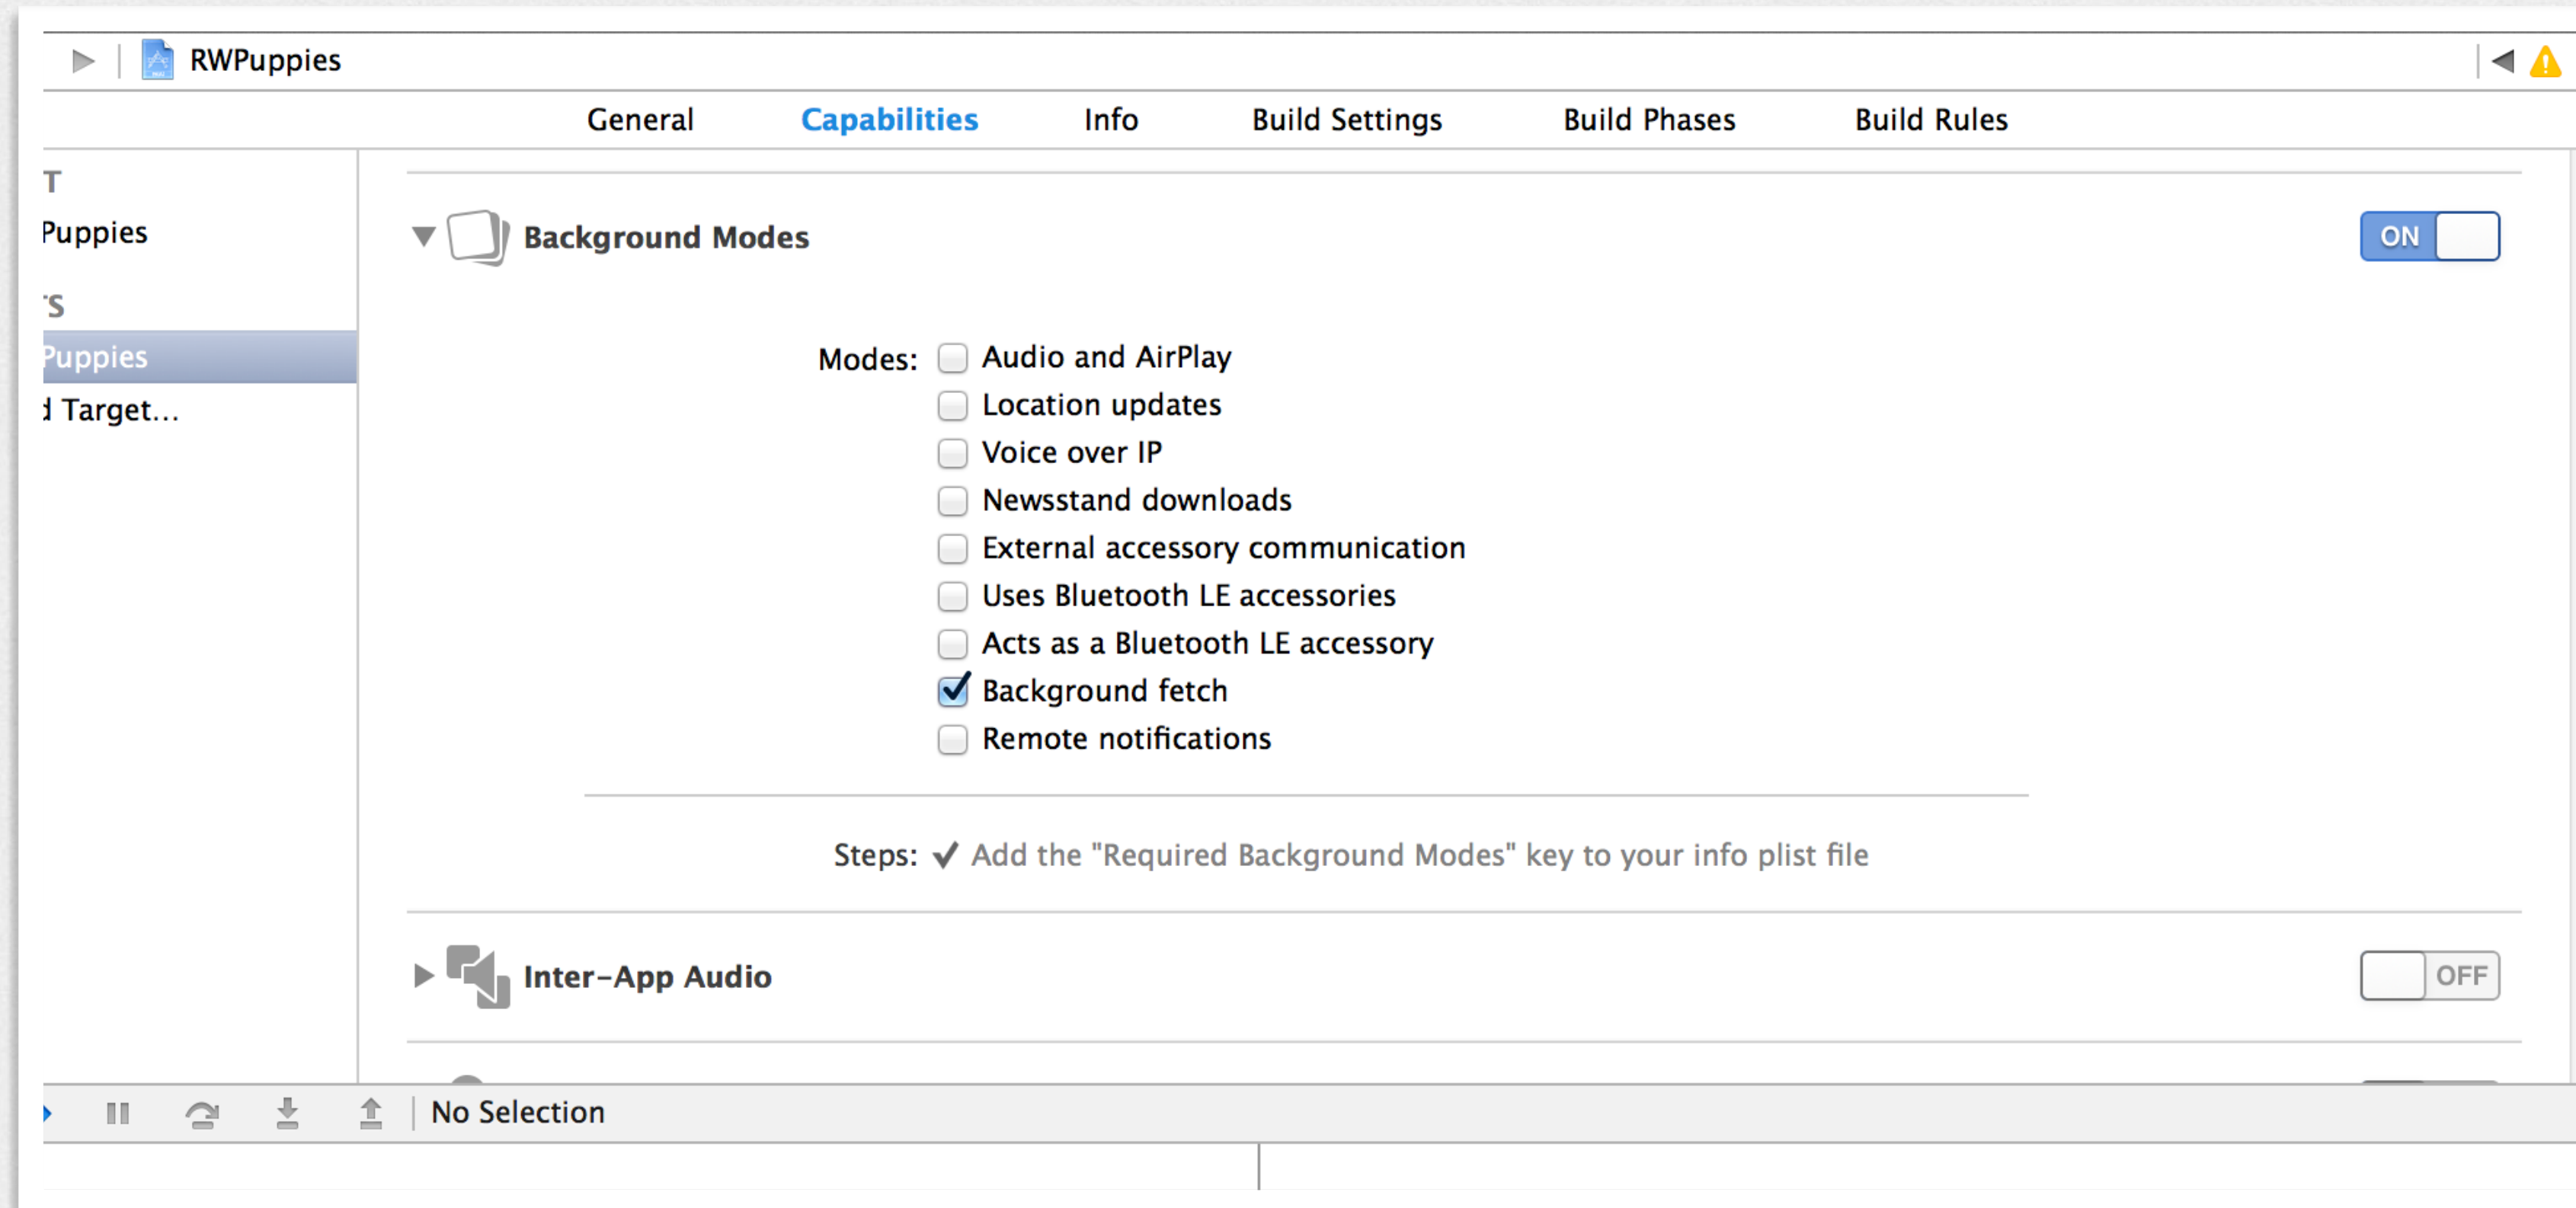

# Background Fetching (1)

---

- ⚙️ **Motivation:** The user should always see freshest content available. Also, app switcher screenshot should be as recent as possible.
- ⚙️ Possible applications: social networking feeds, news, entertainment, weather, finance, etc
- ⚙️ Background fetching is not guaranteed. Up to the OS.

# Background Fetching (2)

# Background Fetching (3)

---

```
- (void)application:(UIApplication *)application  
performFetchWithCompletionHandler:(void (^)(UIBackgroundFetchResult result))completionHandler;
```

- ⚙ Call completion handler when done.
- ⚙ Report appropriate **UIBackgroundFetchResult**
  - ⚙ UIBackgroundFetchResultNewData
  - ⚙ UIBackgroundFetchResultNoData
  - ⚙ UIBackgroundFetchResultFailed
- ⚙ Set an appropriate minimum background fetch interval on UIApplication.

# Background Fetching DEMO

# Remote Notifications (1)

---

- ⚙ Regular push notifications revamped in iOS 7.
- ⚙ New in iOS 7: **Silent** push notifications.
- ⚙ Possible applications for silent push notifications:
  - ⚙ Syncing: file syncing, purchase syncing
  - ⚙ Episodic content: new TV episodes, new podcast
- ⚙ Silent push notifications are rate limited.

# Remote Notifications (2)

General

Capabilities

Info

Build Settings

Build Phases

Build Rules

▼  Background Modes 

ON

Modes:

☐ Audio and AirPlay

☐ Location updates

☐ Voice over IP

☐ Newsstand downloads

☐ External accessory communication

☐ Uses Bluetooth LE accessories

☐ Acts as a Bluetooth LE accessory

☐ Background fetch

☒ Remote notifications

Steps:

✓ Add the "Required Background Modes" key to your info plist file

▶  Inter-App Audio

# Remote notifications (3)

## **Old push notification**

*iOS 6 and prior*

```
aps {  
  alert: {...}  
}
```

```
- (void)application:  
(UIApplication *)application  
didReceiveRemoteNotification:  
(NSDictionary *)userInfo;
```

## **New push notification**

*iOS 7*

```
aps {  
  content-available:1  
  alert: {...}  
}
```

```
- (void)application:  
(UIApplication *)application  
didReceiveRemoteNotification:  
(NSDictionary *)userInfo  
fetchCompletionHandler:(void (^)(  
  UIBackgroundFetchResult  
  result))handler;
```

## **Silent push notification**

*iOS 7*

```
aps {  
  content-available:1  
}
```

```
- (void)application:  
(UIApplication *)application  
didReceiveRemoteNotification:  
(NSDictionary *)userInfo  
fetchCompletionHandler:(void (^)(  
  UIBackgroundFetchResult  
  result))handler;
```

# Background Transfer Service (1)

---

- ⚙️ **Motivation:** Before iOS 7, large uploads or downloads often couldn't complete. Background task API didn't allow enough time.
- ⚙️ In iOS 7, create `NSURLSession` with a background configuration. Add download or upload tasks.
- ⚙️ Background uploads and downloads are up to the OS.

# Background Transfer Service (2)

---

```
// Create background configuration
NSURLSessionConfiguration *configuration =
    [NSURLSessionConfiguration backgroundSessionConfiguration:@"foo"];

// Create NSURLSession
self.urlSession =
    [NSURLSession sessionWithConfiguration:configuration delegate:self delegateQueue:nil];

// Create off download task
NSURLRequest *request = [NSURLRequest requestWithURL:someURL];
self.downloadTask = [self.urlSession downloadTaskWithRequest:request];

// Resume to begin
[self.downloadTask resume];

/* Implement NSURLSessionDownloadTaskDelegate, NSURLSessionTaskDelegate, etc... */
```

# Background Transfer Service (3)

---

```
#pragma mark – Background Transfer Service
```

```
– (void)application:(UIApplication *)application handleEventsForBackgroundURLSession:(NSString *)identifier completionHandler:(void (^)(void))completionHandler {  
    if ([identifier isEqualToString:@"foo"]) {  
        // 1. Pass in completion handler as needed  
        // 2. Refresh UI as needed  
        // 3. Execute completion handler  
    }  
}
```

# Potential Problems

---

- ⚙ Data protection. Make sure sensitive data is handled appropriately when operating in the background.
- ⚙ Privacy concerns. Be careful what you show in the app switcher.

# One last thing...

---

- ⚙️ What does the future of multitasking look like in iOS?
